Intuitive, analyzable

Modelling a coffee shop: Attempt 1

Finite automata with cost labels, a la Mealy machines

・ロト・4日・4日・4日・4日・900

- ► Intuitive, analyzable
- But not very expressive...

Modelling a coffee shop: Attempt 1

What if the survey gives us a discount for coffee already purchased?

・ロト ・ 日 ・ モ ト ・ 日 ト ・ 日 ト ・ ク ヘ ヘ

- Not possible if costs are paid up front
- Cost of an event cannot be influenced by later events

Modelling a coffee shop: Attempt 1

What if the survey gives us a discount for coffee already purchased?

・ロト ・ 日 ・ モ ト ・ 日 ト ・ 日 ト ・ ク ヘ ヘ

- Not possible if costs are paid up front
- Cost of an event cannot be influenced by later events

Solution?

Modelling a coffee shop: Attempt 1

What if the survey gives us a discount for coffee already purchased?

・ロト ・ 日 ・ モ ト ・ 日 ト ・ 日 ト ・ ク ヘ ヘ

- Not possible if costs are paid up front
- Cost of an event cannot be influenced by later events

Solution? Registers!

Regular Functions / Cost Register Automata Modelling a coffee shop: Attempt 2

Motivating Question

Register complexity

Does the coffee shop CRA really need 2 registers?

・ロト・4日・4日・4日・4日・900

Confessions of a coffee addict

• Pick a large number, say c = 1,000,000

Confessions of a coffee addict

- Pick a large number, say c = 1,000,000
- Observe what happens after processing $C^c = CC \dots C$

Confessions of a coffee addict

- Pick a large number, say c = 1,000,000
- Observe what happens after processing $C^c = CC \dots C$
- $|x-y| \ge c$

- ▶ In general, for each c, there is a path to $q_{\neg S}$ so $|x y| \ge c$
- No 1-register machine can make up these arbitrary differences in finite time

▲□▶ ▲圖▶ ▲圖▶ ▲圖▶ 圖圖 のへぐ

Generalizing to k registers

- ▶ Pick a state *q*, and *k* registers
- ▶ Say, for each *c*, there is a string to *q* so every pair is at least *c* apart

▶ Then *k* registers are really necessary

Register Separation Establishing the Converse

Establishing the converse

Claim

If the registers are not k-separable, then k-1 registers suffice

Establishing the converse

Claim

If the registers are not k-separable, then k-1 registers suffice

Separation: $\exists q, \forall c, \exists \sigma, \forall u, v, |u - v| \ge c$

Establishing the converse

Claim

If the registers are not k-separable, then k-1 registers suffice

・ロト ・ 日 ・ モ ト ・ 日 ト ・ 日 ト ・ ク ヘ ヘ

Non-Separation: $\forall q, \exists c, \forall \sigma, \exists u, v, |u - v| < c$

Establishing the converse

Claim

If the registers are not k-separable, then k-1 registers suffice

・ロト ・ 日 ・ モ ト ・ 日 ト ・ 日 ト ・ ク ヘ ヘ

Non-Separation: $\exists c, \forall q, \forall \sigma, \exists u, v, |u - v| < c$

Establishing the converse

Claim

If the registers are not k-separable, then k-1 registers suffice

・ロト ・ 日 ・ モ ト ・ 日 ト ・ 日 ト ・ ク ヘ ヘ

Non-Separation: $\exists c, \forall \sigma, \forall q, \exists u, v, |u - v| < c$

Establishing the converse

Claim

If the registers are not k-separable, then k-1 registers suffice

Non-Separation: $\exists c, \forall \sigma, \forall q, \exists u, v, |u - v| < c$

Establishing the converse

Claim

If the registers are not k-separable, then k-1 registers suffice

Non-Separation: $\exists c, \forall \sigma, \forall q, \exists u, v, |u - v| < c$

$$\exists c, \forall \sigma, \bigwedge_{q} \bigvee_{u, v} |u - v| < c$$

◆○◇ 単則 《Ⅲ》 《Ⅲ》 《□》

Establishing the converse

 $\exists c, \forall \sigma, \bigwedge \bigvee |u - v| < c$ *q u*,*v*

Establishing the converse

$$\exists c, \forall \sigma, \bigwedge_{q} \bigvee_{u,v} |u-v| < c$$

$$(q, \langle u, v \rangle, d_{uv})$$

• Says
$$u - v = d_{uv}$$
, where $-c < d_{uv} < c$

• Wherever we see "v", replace with " $u - d_{uv}$ "

▲□▶ ▲□▶ ▲□▶ ▲□▶ 三回■ のへで

Establishing the converse

$$(q, \langle u, v \rangle, d_{uv}) \longrightarrow (q', \langle _, _ \rangle, _)$$

 $(-c < u' - v' < c) \lor \dots$

・ロト ・ (日)・ (日)・ (日)・ (日)・ (日)・

Establishing the converse

$$\exists c, \forall \sigma, \bigwedge_{q} \bigvee_{u,v} |u - v| < c$$

$$(q, \langle u, v \rangle, d_{uv}) \xrightarrow{u' := u'' + 2} (q', \langle _, _ \rangle, _)$$

$$(-c < u' - v' < c) \lor \dots$$

▲□▶ ▲圖▶ ▲目▶ ★目▶ 目目 のへぐ

▶ Says u - v = d_{uv}, where -c < d_{uv} < c
 ▶ Wherever we see "v", replace with "u - d_{uv}"

Establishing the converse

$$\exists c, \forall \sigma, \bigwedge_{q} \bigvee_{u,v} |u - v| < c$$

$$(q, \langle u, v \rangle, d_{uv}) \xrightarrow{u' := u'' + 2} (q', \langle _, _ \rangle, _)$$

$$(-c + 1 < u'' - v'' < c) \lor \dots \longleftarrow (-c < u' - v' < c) \lor \dots$$

Establishing the converse

$$\exists c, \forall \sigma, \bigwedge_{q} \bigvee_{u,v} |u - v| < c$$

$$\left(q, \left\{ \begin{array}{c} \langle u, v \rangle, & d_{uv} \\ \langle u'', v'' \rangle, & d_{u''v''} \end{array} \right\} \right) \xrightarrow{u' := u'' + 2} (q', \langle _, _ \rangle, _)$$

$$(-c + 1 < u'' - v'' < c) \lor \dots \longleftarrow (-c < u' - v' < c) \lor \dots$$

Inductive backpropagation!

Invariants maintained in DNF form

Establishing the converse

$$\exists c, \forall \sigma, \bigwedge_{q} \bigvee_{u,v} |u - v| < c$$

$$\left(q, \left\{ \begin{array}{c} \langle u, v \rangle, & d_{uv} \\ \langle u'', v'' \rangle, & d_{u''v''} \end{array} \right\} \right) \xrightarrow{u' := u'' + 2} \quad (q', \langle u', v' \rangle, d_{u''v''} - 1)$$

$$(-c + 1 < u'' - v'' < c) \lor \dots \longleftarrow (-c < u' - v' < c) \lor \dots$$

Inductive backpropagation!

Invariants maintained in DNF form

Establishing the converse

Establishing the converse

$\mathtt{INV}\left(q ight):=\mathtt{INV}\left(q ight)\wedge \mathtt{WP}\left(\mathtt{INV}\left(q' ight), au ight)$

Repeat at each transition τ until fixpoint

・ロト・4回ト・4回ト・4回ト・4回ト

Establishing the converse

イロト 不得 トイヨト イヨト ノロト

Repeat at each transition τ until fixpoint

Claim A fixpoint will eventually be reached

Final result

Theorem

The register complexity is at least k iff the registers are k-separable

4日 + 4日 + 4日 + 4日 - 940

Final result

Theorem

The register complexity is at least k iff the registers are k-separable

▲□▶ ▲圖▶ ▲目▶ ★目▶ 目目 のへぐ

Theorem

Computing the register complexity is PSPACE-complete

Conclusion

Conclusion

What we talked about

- Described CRAs as a model for regular functions
- Introduced register separation in CRAs
- Outlined connection between separation and register complexity

▲□▶ ▲圖▶ ▲圖▶ ▲圖▶ 圖圖 のへぐ

Conclusion

What we didn't talk about, i.e. what else is in the paper

- ▶ Machine-independent characterization of the register complexity
- ► Analysis of adversarial games over CRAs optimal reachability Undecidable when domain is Z EXPTIME-complete when domain is N

・ロト ・ 日 ・ モ ト ・ 日 ト ・ 日 ト ・ ク ヘ ヘ

► Proofs!

Conclusion What's left to do

 Understanding register separation in models with binary addition, SSTs, etc.

▲□▶ ▲圖▶ ▲圖▶ ▲圖▶ 圖圖 のへぐ

- Optimal reachability in probabilistic variants
- Variants for ω -strings / trees / ...

Thank you! Questions?

Reserve Slides

Gotchas

- ▶ Definition engineering; claims remain true in spirit
- Consider hypothetical "constant-0" register

Gotchas

Domain of computation / Algebraic structure "+"

- Paper assumes \mathbb{Z} ; also holds for \mathbb{N}
- \blacktriangleright Free algorithm for $\mathbb{Q}:$ The rationals admit a notion of "GCD"

・ロト ・ 日 ・ モ ト ・ 日 ト ・ 日 ト ・ ク ヘ ヘ

Conjecture

- Similar results hold for \mathbb{R} as well
- Can be easily generalized to any commutative group

Reserve Slides

Weighted automata

Connection to weighted automata

Use non-determinism!

▲□▶ ▲圖▶ ▲圖▶ ▲圖▶ 圖圖 のへぐ

Connection to weighted automata

Use non-determinism!

▲□▶ ▲圖▶ ▲圖▶ ▲圖▶ 圖圖 のへぐ

Connection to weighted automata

- CRAs are equivalent to unambiguous WA
- ► CRA (min, +c) equivalent to (full) WA x := min (x, y), y := z + 3
- Weighted automata are inherently non-deterministic

・ロト ・ 日 ・ モ ト ・ 日 ト ・ 日 ト ・ ク ヘ ヘ
